

Passwordless Authentication

The time is now, and help is here

To successfully secure applications and data in the digital world, organizations need secure access that doesn't rely on passwords.

Hard to remember and easy to breach, passwords have always posed a security problem. But the problem has become much more critical now, with growing numbers of people accessing applications and data from far beyond traditional security perimeters. To successfully secure applications and data in the digital world, organizations need secure access that doesn't rely on passwords. But how do you go from passwords-for-everything to a passwordless future? By taking it one step at a time, on a path paved by three best practices:

Take a gradual approach that's easy on users

Passwords may be a pain to deal with, but people have become comfortable with them over time. Moving away from passwords gradually will make it easier for users to transition successfully to a new way of authenticating. Begin by adopting modern authentication methods such as biometrics, FIDO and OTP in conjunction with, rather than in place of, passwords. It's a less disruptive approach that helps ensure users stay productive as they adapt to the change.

Make authenticating both secure and convenient

The point of moving beyond passwords is improving your security posture, of course—but it's important to do so without sacrificing convenience for users in the process. A key part of achieving this balance is implementing risk intelligence to determine how and when step-up authentication is needed. This can be a gradual process that moves from static policies to conditional access to dynamic, real-time risk-scoring.

Apply strong authentication at weak points

The risk of compromised credentials is highest at the weakest points in the credential lifecycle, including enrollment, password reset and emergency access. In the transition to passwordless authentication, make these the first points protected by strong authentication methods that don't rely on traditional passwords.

RSA: A smooth path to your passwordless future

RSA is the identity management platform security-sensitive organizations trust on-premises and in the cloud, with:

- **A broad range of authenticator choices** for passwordless authentication, including FIDO, push-to-approve, biometrics (fingerprint and facial), “bring your own authenticator” and hardware tokens that represent the gold standard for authentication
- **RSA Ready partner relationships** with FIDO authentication leaders to ensure out-of-the-box interoperability with FIDO-based passwordless solutions
- **Risk scoring informed by advanced machine learning and AI** capabilities that calculate access risk based on business context, device attributes and behavioral characteristics, and step up authentication accordingly
- **Protected self-service credential management options** that eliminate password-dependent workflows to shore up security at weak points in onboarding, credential recovery and emergency access
- **Always-on strong authentication**, with 99.95% availability and a unique “no-fail” capability for Windows and macOS that ensures secure, convenient access even when network connectivity is interrupted

About RSA

RSA provides trusted identity and access management for 12,000 organizations around the world, managing 25 million enterprise identities and providing secure, convenient access to millions of users. RSA empowers organizations to thrive in a digital world, with complete capabilities for modern authentication, lifecycle management and identity governance. Whether in the cloud or on-premises, RSA connects people with the digital resources they depend on everywhere they live, work and play. For more information, go to [RSA.com](https://www.rsa.com).
